## **DETAILED ACTION**

This non-final office action is in response to amendments filed on 3/19/07.

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1, 5-8, 15, 16, 20, 21 and 26-28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Shteyn et al., US Patent Application Publication no. 2003/0040344 [Shteyn].

Regarding claim 1, Shteyn discloses a method of delivering power comprising:

using a battery charging circuit to transfer power from a laptop computer system in a network to a first receiving device in the network [monitor, paragraph 0011]; and

using the battery charging circuit to transfer power from the laptop computer system to a second receiving device in the network, the first and second receiving devices being different types of devices [PDA, paragraph 0012];

wherein using the battery charging circuit to transfer power includes transferring power through an inductive coupling charge transmitter in the laptop computer system to the receiving devices [paragraphs 0011-0012].

Shteyn is silent as to where the inductive coupling charge transmitter is located on the laptop computer system. However, it would have been obvious to one of ordinary skill in the art to place the inductive coupling charge transmitter on the lid of the laptop in order to enable convenient recharging of the receiving devices without the need for an add-on docking device.

Application/Control Number: 10/757,914

Art Unit: 2116

Regarding claims 5-8, Shteyn discloses providing power from a laptop to a plurality of devices, including a monitor, a PDA and a headset.

Applicant's numerous definitions of devices which receive power from the computer system (personal digital assistant, wireless phone, digital camera and wireless headset) is construed to be an admission that the criticality does not reside in what type of device receives power from the computer system and hence are obvious variations of one another.

Regarding claim 15, Shteyn discloses a battery charging circuit comprising:

a power delivery module [inherent that some module is used to deliver the power from the laptop to the receiving device]; and

a charge transfer interface located in a laptop computer system and operatively coupled to the power delivery module, the power delivery module to transfer power from a power supply through the charge transfer interface to different types of receiving devices [paragraphs 0011-0012];

wherein the charge transfer interface is an inductive coupling charge transmitter [paragraphs 0011-0012].

Shteyn is silent as to where the inductive coupling charge transmitter is located on the laptop computer system. However, it would have been obvious to one of ordinary skill in the art to place the inductive coupling charge transmitter on the lid of the laptop in order to enable convenient recharging of the receiving devices without the need for an add-on docking device.

Regarding claim 16, Shteyn discloses providing power from a laptop to a plurality of devices, including a monitor, a PDA and a headset.

Regarding claim 20, Shteyn discloses a computer system comprising:

a power supply [laptop, paragraphs 0011-0012];

a power delivery module [inherent that some module is used to deliver the power from the laptop to the receiving device]; and

a charge transfer interface located in a lid of a laptop computer system and operatively coupled to the power delivery module, the power delivery module to transfer power from the power supply through the charge transfer interface to different types of receiving devices [[paragraphs 0011-0012];

wherein the charge transfer interface is an inductive coupling charge transmitter [paragraphs 0011-0012].

Shteyn is silent as to where the inductive coupling charge transmitter is located on the laptop computer system. However, it would have been obvious to one of ordinary skill in the art to place the inductive coupling charge transmitter on the lid of the laptop in order to enable convenient recharging of the receiving devices without the need for an add-on docking device.

Regarding claim 21, Shteyn discloses providing power from a laptop to a plurality of devices, including a monitor, a PDA and a headset.

Regarding claims 26-28, Shteyn discloses that the power supply is a laptop [paragraphs 0011-0012].

Applicant's numerous definitions of what type of power supply is used (an AC adapter, a DC power source or a fuel cell) is construed to be an admission that the criticality does not reside in what type of power supply is used and hence are obvious variations of one another.

Claims 9,14, 17, 22 and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Shteyn et al., US Patent Application Publication no. 2003/0040344 [Shteyn], in view of Wong et al., US Patent no. 6,614,206 [Wong].

Regarding claims 9, 17 and 22, Shteyn does not disclose that the recharging may be performed though a USB cable. However, as disclosed by Wong, providing power from a laptop computer to a plurality of devices through a USB cable is well known in the art [column 5, lines 23-37]. It would have been obvious to one of ordinary skill in the art to use the well known USB charging in the Shteyn laptop to increase the compatibility the charging method.

Regarding claims 14 and 24, Wong further discloses using the battery charging circuit to transfer data from the source device to at least one of the receiving devices [column 6, lines 6-19].

Claims 11-13, 19, 25 and 29-32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Shteyn et al., US Patent Application Publication no. 2003/0040344 [Shteyn], in view of Kerai et al., US Patent no. 6,531,845 [Kerai].

Regarding claims 11, 19, 25 and 29, Shteyn, as described above, disclosing a laptop computer for inductively charging the batteries of receiving devices. Shteyn does not disclose determining an amount of available power in the source device, determining an amount of needed power in the receiving devices and determining an amount of power to transfer based on the available power and the needed power. Kerai discloses determining an amount of available power in a source device, determining an amount of needed power in receiving devices and determining an amount of power to transfer based on the available power and the needed power

Art Unit: 2116

[column 4, lines 20-59]. It would have been obvious to one of ordinary skill in the art to include the Kerai teachings into the Shteyn method to protect the laptop from using too much battery power while powering the peripheral devices [Kerai, column 4, lines 45-50].

Regarding claims 12 and 13, Kerai discloses denying power transfer from the laptop to the handset when the laptop battery charge level falls below a threshold [column 4, lines 45-50].

Regarding claims 30-32, Shteyn discloses that the power supply is a laptop [paragraphs 0011-0012].

Applicant's numerous definitions of what type of power supply is used (an AC adapter, a DC power source or a fuel cell) is construed to be an admission that the criticality does not reside in what type of power supply is used and hence are obvious variations of one another.

## Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Paul B. Yanchus whose telephone number is (571) 272-3678. The examiner can normally be reached on Mon-Thurs 8:00-6:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Rehana Perveen can be reached on (571) 272-3676. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
